# Nodes

- The most ggplot2-like addition, but…

  - Have position and dimension pre-set

  - Comes with a filter

  - Borrows text/label repel from ggrepel

- Sometimes it is all you need

  - Nodes can show edges by inclusion and/or position

Edges

- Comes in many types and shapes
- Separate scales from nodes
- Have access to terminal node data
    - And can interpolate between them
- Same fancy filter as nodes
- Have autorotating label
- Can get capped around the terminal nodes
